

Portfolio Objective

The objective of this portfolio is to achieve higher levels of capital growth by primarily investing in equity markets. This will entail an above average level of risk and volatility. The managers will not only invest in the UK equity market but also seek to derive value by utilising funds which are invested in overseas markets, being primarily the USA, the Far East including Japan, various Emerging Markets and also the rest of Europe. It is unlikely that fixed income securities will be used within this portfolio. The model portfolio will look to invest mostly in passive investments to achieve the above objectives. This portfolio follows an **internal risk profile** with the highest (i.e. 10 out of 10) attitude to investment risk. The Manager aims to achieve the objectives over a 5 year period.

Commentary

It's been a very strong quarter for equities and credit as central banks and governments provided enormous amounts of stimulus and economies started to reopen. Despite the strong rebound in risk assets, traditional portfolio hedges such as government bonds and gold have held up well. US Treasuries are up about 9% year to date, while gold is up close to 18%.

As economies have started to reopen, economic data has shown signs of a sharp rebound. For example, US retail sales rose 17% month on month in May, while UK retail sales rebounded by 12%. While sales are still down 6% and 13% year on year respectively, the speed and magnitude of the bounce back is a clear positive. The other positive is that central banks globally have made clear that they stand willing to use their full firepower to keep government and corporate borrowing costs low.

The end of June is clearly the half way mark for the year and what strikes me most is how mediocre the UK stock market has been compared to most other major markets. The reason is primarily the makeup of the UK market, industry sector wise there are very few offsets for the; Oils, Banks, Travel, Property, Auto's, Transport, Telecoms, Aerospace and so on which are all down between 20 and 50% this year. Only two sectors are up meaningfully, Leisure Goods and Tech' Hardware, and these two sectors combined make up less than 5% of the index and Brexit and the accompanying UK-EU trade deal hasn't really been on the radar yet.

Overall, the market has rallied on the back of fiscal and monetary stimulus, combined with the reopening of economies. We believe the monetary support is here to stay, but that in some countries there is a risk that fiscal stimulus may become less generous.

Portfolio Information

Investment Risks - This model portfolio predominately gains exposure to higher risk UK and international growth based assets through investment in other investment funds whose individual risk profile may not match that of the model portfolio. Exposure to UK and international markets is through collective funds. Global currency fluctuations contribute to changes in the value of the investment. Sovereign bonds do not represent significant holdings but carry specific investment risks, as the value of bonds are affected by relative movements in interest rates
